Noah Mills

Healthcare IT & security · St. Louis, MO

itsnmills@gmail.com · GitHub · LinkedIn · Resume

Technology has always interested me, security especially. I have a B.S. in Exercise Science and spent time coaching before going all-in on IT and security instead, since it's just a better fit for how I think.

That coaching job mattered more than I expected: handling clients' personal health information every day is what first got me paying attention to how small healthcare practices protect patient data, and that's the problem I keep coming back to. I'm **Security+ and Network+ certified**, finishing a B.S. in Information Technology at WGU, and studying for **CompTIA Project+** now. To actually learn the material, I started building security tools with AI and using the process to teach myself the domain.

I also think AI is going to change how most businesses operate, not just security teams, and I like digging into where it actually helps versus where it's still overhyped. Building the projects below is where that turned from an opinion into something I've actually practiced: working with AI pushed me toward better implementations than I'd have found alone, and taught me how to direct several AI agents across different systems at once instead of running one at a time. I think that shift, from doing the work yourself to orchestrating it, is going to reshape careers over the next five to ten years, mine included.

I'm looking for my next role in IT or security. I'd rather the work make the case than a job title: real projects, documented and public, backed by real certifications. I care about explaining a problem clearly, not just finding it.

STATUS
Open to work · 2026

CERTIFIED
Security+ · **Network+**
Project+ in progress

FOCUS
Healthcare security · GRC · AI governance

Right now

00

Finishing my **B.S. in IT at WGU** and studying for **CompTIA Project+**.

Going back over the projects below: tighter tests, clearer docs, honest notes on their limits.

Reading real healthcare breach write-ups and folding what I learn back into the readiness kit.

Building **Pace**, an Apple Watch lifting-tempo coach, to teach myself Swift and on-device signal processing.

Skills & knowledge

01

HIPAA & COMPLIANCE	HIPAA Security Rule, ePHI data flow mapping, security risk assessments, vendor and BAA management, policy writing, and remediation planning.
SECURITY OPERATIONS	Alert triage and prioritization, CVSS, CISA KEV, MITRE ATT&CK mapping, incident documentation, ticketing, and remediation tracking.
IDENTITY & ACCESS	Least privilege, role-based access control, MFA, account lifecycle, and evidence-backed access reviews.
AI SECURITY & GOVERNANCE	AI vendor risk review, PHI pattern filtering, agent tool permissions, prompt injection risk, and audit logging for AI workflows.
DATA PROTECTION	AES-256-GCM encryption, SHA-256 integrity verification, redaction, and secure report handoff.
TOOLS & SYSTEMS	Python, TypeScript/React, SQL, Git, CI, automated testing. Windows, macOS, Linux, Microsoft 365, Google Workspace.

Building to learn

02

I learn the material by building tools around it, and I'd rather be straight about how I work than pretend otherwise. I lean on AI heavily for the implementation. The part I'm actually developing is the security judgment: deciding what's worth building, checking whether the output holds up, and understanding where the real risk sits. These are the two I know best and can talk through. Both are public and run on synthetic data, never real PHI.

Small Practice Security Kit ↗

PUBLIC · TESTED

A local-first tool that turns a small practice's intake answers into a HIPAA readiness packet: where ePHI actually lives, which vendors need BAAs, and a 30/60/90-day action list. Runs on a synthetic clinic profile, never real patient data.

WHAT IT TAUGHT ME: *most of the work here was domain, not code. Reading the HHS Security Rule, 405(d), and CISA's baseline goals closely enough to decide what a small practice actually has to answer is the part I can stand behind.*

PHI Guardrails for AI Agents ↗

PUBLIC

Deterministic RBAC, purpose-of-use, BAA, and PHI-pattern checks that run before an AI agent is allowed to act, with block, redact, and proceed paths and an audit log.

WHAT IT TAUGHT ME: *this one is closest to how I think work is heading. Keeping AI useful in healthcare means putting hard, checkable rules in front of it instead of trusting it to behave, and building this is how I started to see where those rules have to live.*

Also building

03 · PACE

Not everything I build is security work. Pace is a personal project that connects my exercise-science background to the engineering side I'm growing into: an Apple Watch and iPhone app that coaches lifting tempo from wrist motion, entirely on-device.

Pace

PRIVATE · IN DEVELOPMENT

An Apple Watch movement-coaching prototype. It reads wrist motion during dumbbell curls, detects the lift, top, and lower phases of each rep, and coaches lowering tempo with haptics. All detection runs on the Watch: no account, no network, and no sensor data ever leaves the device.

WHAT IT TAUGHT ME: *Swift and watchOS from scratch, and how much care real signal processing takes. I wrote the rep detector as a tested state machine, replay recorded motion as regression fixtures, and kept the docs honest about what the sensors can and can't prove.*

Swift · SwiftUI · watchOS · HealthKit · Core Motion · on-device, no network · CI + golden-fixture tests

Work history

04

2023 – present	**Delivery Associate** · Amazon, St. Louis My day job while I finish my degree and build the projects above. High volume, metrics driven work where I troubleshoot on my own and document everything: access issues, exceptions, escalations, recovery actions.
2022 – 2023	**Personal Trainer** · The Exercise Coach, St. Louis This is where the healthcare security focus started. I worked with clients' personal health information every day, explained complicated health concepts in plain language, and saw firsthand how loosely small health businesses handle sensitive data.

Certifications & education

05

CERTIFICATION
CompTIA Security+
Certified

CERTIFICATION
