Noah Mills

Healthcare IT & security · St. Louis, MO

itsnmills@gmail.com · GitHub · LinkedIn · Resume

Technology has always interested me, security especially. I have a B.S. in Exercise Science and spent time coaching before going all-in on IT and security instead, since it's just a better fit for how I think.

That coaching job mattered more than I expected: handling clients' personal health information every day showed me how little protection that data gets at small healthcare practices, and that's the problem I keep coming back to. I'm **Security+ and Network+ certified**, finishing a B.S. in Information Technology at WGU, and studying for **CompTIA Project+** now. To actually learn the material, I started building: five projects so far, each one written up clearly enough that someone else could follow the reasoning.

I also think AI is going to change how most businesses operate, not just security teams, and I like digging into where it actually helps versus where it's still overhyped. Building the projects below is where that turned from an opinion into something I've actually practiced: working with AI pushed me toward better implementations than I'd have found alone, and taught me how to direct several AI agents across different systems at once instead of running one at a time. I think that shift, from doing the work yourself to orchestrating it, is going to reshape careers over the next five to ten years, mine included.

I'm looking for my next role in IT or security. I'd rather the work make the case than a job title: real projects, documented and public, backed by real certifications. I care about explaining a problem clearly, not just finding it.

FOCUS
Healthcare security · GRC · AI governance

Right now

00

Finishing my **B.S. in IT at WGU** and studying for **CompTIA Project+**.

Going back over the projects below: tighter tests, clearer docs, honest notes on their limits.

Reading real healthcare breach write-ups and folding what I learn back into the readiness kit.

Building **Pace**, an Apple Watch lifting-tempo coach, to teach myself Swift and on-device signal processing.

Skills & knowledge

01

HIPAA & COMPLIANCE	HIPAA Security Rule, ePHI data flow mapping, security risk assessments, vendor and BAA management, policy writing, and remediation planning.
SECURITY OPERATIONS	Alert triage and prioritization, CVSS, CISA KEV, MITRE ATT&CK mapping, incident documentation, ticketing, and remediation tracking.
IDENTITY & ACCESS	Least privilege, role-based access control, MFA, account lifecycle, and evidence-backed access reviews.
AI SECURITY & GOVERNANCE	AI vendor risk review, PHI pattern filtering, agent tool permissions, prompt injection risk, and audit logging for AI workflows.
DATA PROTECTION	AES-256-GCM encryption, SHA-256 integrity verification, redaction, and secure report handoff.
TOOLS & SYSTEMS	Python, TypeScript/React, SQL, Git, CI, automated testing. Windows, macOS, Linux, Microsoft 365, Google Workspace.

What I've been building

02 · THE VELARI SUITE

These started as a way to teach myself the material by actually doing it, and grew into five projects that fit together as the **Velari Healthcare Security Suite**, a rough end-to-end security readiness workflow for small practices. They're works in progress, and I keep iterating. Public repos include docs, tests, CI, and synthetic, no-PHI data.

Small Practice Security Kit ↗

PUBLIC

HIPAA readiness assessments: maps ePHI flows, vendor/BAA status, and access gaps into owner-ready remediation packets with 30/60/90 day plans.

WHAT IT TAUGHT ME: *how to translate the HIPAA Security Rule into steps a non-technical practice owner can actually follow.*

HealthAI Audit ↗

PUBLIC · CI + TESTS

AI governance auditor that scores a practice's AI tools across six risk domains and generates vendor risk cards, an AI use policy, and a vendor questionnaire.

WHAT IT TAUGHT ME: *my first time wiring CI and a real test suite around my own scoring logic, and making that scoring explainable instead of a black box.*

Security Operations Triage Pipeline ↗

PUBLIC · CI + TESTS

Turns scanner and alert exports into prioritized, MITRE ATT&CK-mapped tickets with explainable scoring and encrypted, integrity-verified handoff bundles.

WHAT IT TAUGHT ME: *that a lot of triage is really prioritization and a clean handoff, not just detecting things.*

Velari Secure Practice OS

PRIVATE · DEMO ON REQUEST

Full local-first security program workspace for practices without a security team: inventory, access reviews, risk treatment, and encrypted evidence management.

WHAT IT TAUGHT ME: *my most ambitious build, and still the roughest: how much scope a "whole program" really is, and where to cut it down.*

PHI Guardrails for AI Agents ↗

PUBLIC · CI + DEMO UI

Deterministic RBAC, purpose-of-use, BAA, and PHI pattern checks that run before an AI agent executes, with block/redact/proceed paths and audit logs.

WHAT IT TAUGHT ME: *to treat AI safety as deterministic checks that run before the model acts, instead of trying to catch problems after.*

Also building

03 · PACE

Not everything I build is security work. Pace is a personal project that connects my exercise-science background to the engineering side I'm growing into: an Apple Watch and iPhone app that coaches lifting tempo from wrist motion, entirely on-device.

Pace

PRIVATE · IN DEVELOPMENT

An Apple Watch movement-coaching prototype. It reads wrist motion during dumbbell curls, detects the lift, top, and lower phases of each rep, and coaches lowering tempo with haptics. All detection runs on the Watch: no account, no network, and no sensor data ever leaves the device.

WHAT IT TAUGHT ME: *Swift and watchOS from scratch, and how much care real signal processing takes. I wrote the rep detector as a tested state machine, replay recorded motion as regression fixtures, and kept the docs honest about what the sensors can and can't prove.*

Swift · SwiftUI · watchOS · HealthKit · Core Motion · on-device, no network · CI + golden-fixture tests

Work history

04

2023 – present	**Delivery Associate** · Amazon, St. Louis My day job while I finish my degree and build the projects above. High volume, metrics driven work where I troubleshoot on my own and document everything: access issues, exceptions, escalations, recovery actions.
2022 – 2023	**Personal Trainer** · The Exercise Coach, St. Louis This is where the healthcare security focus started. I worked with clients' personal health information every day, explained complicated health concepts in plain language, and saw firsthand how loosely small health businesses handle sensitive data.

Certifications & education

05

CERTIFICATION
CompTIA Security+
Certified
