Noah Mills

IT Support / Cybersecurity Analyst

Ballwin, MO (St. Louis Metro) | (636) 388-2491 | 17nmills@gmail.com | github.com/itsnmills

Target roles: IT Support Analyst | Cybersecurity Analyst | Security Operations Support | IAM / Access Analyst | Healthcare IT Support

PROFESSIONAL SUMMARY

Security+ and Network+ certified IT/cybersecurity candidate with hands-on public and private GitHub projects across healthcare security readiness, security operations triage, PHI-aware AI controls, access review, and evidence reporting. Strong at turning unclear technical issues into documented findings, tickets, runbooks, remediation steps, and stakeholder-ready summaries. Background in high-accountability operations and health coaching adds discipline in customer communication, safety, documentation, and service continuity.

CORE SKILLS

- **IT and systems support:** Windows, macOS, Linux, Office 365, troubleshooting, ticket notes, user communication, root-cause notes, escalation, and handoff discipline
- **Security operations:** alert triage concepts, SIEM/SOAR workflow awareness, incident notes, SOPs, shift handoffs, vulnerability prioritization, and remediation tracking
- **Identity and access:** MFA, least privilege, account lifecycle, access reviews, role-based access, security change control, and evidence-backed access documentation
- **Automation and reporting:** Python, SQL, Excel, CSV/JSON, Markdown, dashboards, metrics definitions, data quality checks, Git/GitHub, and repeatable documentation workflows
- **Healthcare security context:** HIPAA Security Rule awareness, PHI/ePHI workflows, BAA/vendor review, AI data-use boundaries, downtime and ransomware readiness, and privacy-first evidence handling

SELECTED TECHNICAL PROJECTS

Small Practice Security Kit

Public GitHub | Python, Flask, CLI automation, YAML/JSON schemas, local dashboard, Google Workspace/Microsoft 365 metadata connectors, evidence packet builder

- Built a local-first healthcare security readiness workflow that maps ePHI flows, vendors, AI usage, evidence references, and 30/60/90 remediation actions into owner-ready packets.
- Added structured imports, official metadata connector handling, validation checks, and deterministic exports so review packets stay evidence-based and PHI-avoidant.
- Created dashboard and packet outputs that translate security controls, vendor/BAA status, MFA/access gaps, and readiness findings into practical next actions for owners and MSPs.

Velari Secure Practice OS

Private GitHub - demo available on request | TypeScript, React, Vite, localStorage, WebCrypto AES-GCM, privacy filter, evidence vault, packet exports

- Built a local-first small-practice security operations workspace for systems inventory, ePHI flow mapping, vendor/BAA tracking, access reviews, downtime planning, risk treatment, and evidence management.
- Implemented PHI-avoidant guardrails, local export redaction preview, encrypted workspace backup/import, metadata-only audit history, and packet builders for MSP, SRA, insurance, and reviewer handoffs.
- Added recurring security task workflows, control crosswalks, readiness reporting, DNS security checks, and AI workflow decision support without requiring hosted accounts or cloud data storage.

Security Operations Triage Pipeline

Public GitHub | Python, pytest, CSV/JSON/Markdown/HTML/PDF outputs, MITRE ATT&CK mapping, SHA-256 manifests, AES-256-GCM handoff bundles

- Built a local security operations pipeline that turns alert exports, vulnerability records, CISA KEV-style data, asset inventory, and false-positive overrides into prioritized tickets and review packets.
- Added deterministic scoring with ransomware relevance, internet exposure, ePHI workflow impact, missing-owner flags, evidence references, MITRE ATT&CK tags, and clear next actions.
- Implemented validation, sensitive-data warnings, integrity manifests, and encrypted export support for safer analyst-to-owner or analyst-to-MSP handoffs.

Strands PHI Guardrails Demo

Public GitHub | Python, Strands Agents, RBAC checks, purpose-of-use checks, BAA endpoint checks, PHI pattern filtering, audit logs

- Built deterministic healthcare AI guardrails that check role, purpose of use, BAA status, sensitivity tier, and PHI patterns before agent/tool execution.
- Added block/redact/proceed decision paths, structured audit logs, and test scenarios to demonstrate enforceable controls instead of prompt-only policy guidance.
- Mapped controls to practical healthcare AI safety needs: minimum necessary access, approved endpoints, PHI output filtering, and reviewer-friendly evidence trails.

PROFESSIONAL EXPERIENCE

Amazon - Delivery Associate

St. Louis, MO | 2023-Present

- Handled high-volume, time-sensitive operations while maintaining safety, accuracy, service continuity, and clear exception documentation.
- Documented access issues, route exceptions, escalation details, and recovery actions in a metrics-driven environment requiring independent troubleshooting.

The Exercise Coach - Personal Trainer

St. Louis, MO | 2022-2023

- Delivered structured, safety-focused coaching to clients with different health literacy levels, physical needs, and communication styles.
- Translated complex health and performance concepts into clear next actions, building communication habits that transfer to IT support and security risk education.
- Maintained client trust, schedule discipline, documentation quality, and careful handling of personal health context in a healthcare-adjacent service environment.

EDUCATION

- B.S. Information Technology - Western Governors University, in progress / near completion
- B.S. Exercise Science - Maryville University, 2022

CERTIFICATIONS

- CompTIA Security+
- CompTIA Network+

PORTFOLIO
