Google Workspace
RBAC / MFA
Least privilege
HIPAA Security Rule
ePHI mapping
Vendor / BAA review
DNS / DHCP / TCP/IP
Python
SQL
Git
Docker
Automated testing

ST. LOUIS

SECURITY+ · NETWORK+

Noah Mills

I like taking systems apart, understanding how they fail, and leaving them safer than I found them. Healthcare is the domain I have gone deepest in, but the through-line is IT, security, and cyber.

SUMMARY

I have CompTIA Security+ and Network+, and I will finish my B.S. in Information Technology at WGU in December 2026. I got into this because I like figuring out how a system actually behaves, where it breaks, and how you prove you fixed it, which is also why a lot of my work has been in healthcare: where the data lives, who should be allowed to touch it, and what you write down when something goes wrong. The projects below are how I practiced that on real systems, and at my day job I already work that way. If something breaks I figure it out, finish the day, and leave a record.

SELECTED WORK

Small Practice Security Kit

github.com/itsnmills/small-practice-security-kit

- I built a local tool that takes a short intake about a small practice and writes a readiness packet covering where ePHI would live outside the EHR, which vendors need BAAs, what evidence is missing, and a 30/60/90 day list.
- It includes 30 controls across five families (12 technical, 6 administrative, 6 vendor/BAA/AI, 4 operational, 2 physical), eight packet sections, and 103 automated tests, and it has only ever run on synthetic clinic data.

PHI Guardrails for AI Agents

github.com/itsnmills/Strands-PHI-Guardrails-Demo

- This is a working demo of the checks that should run before an AI agent can touch records or tools, including role, purpose of use, BAA status, and PHI-pattern detection, with block, redact, or proceed paths and an audit log.
- It models six clinical roles and 16 eval cases with expected ALLOW or BLOCK outcomes that I test without calling a model. The data is synthetic, and this is a control pattern rather than a compliance product.

HealthAI Audit

Private repo

- A local CLI that takes an AI-tool inventory for a clinic and produces vendor risk cards, BAA and PHI-handling gaps, and a prioritized remediation list in Markdown, JSON, and CSV.
- It has 28 automated tests and a sample dental/MSP inventory, and it is built so nothing sensitive has to leave the machine.

EXPERIENCE

Delivery Associate Amazon, St. Louis

2023 - Present

- I have run a high-volume delivery route on my own since 2023, with no supervisor on the street, so when something goes wrong I diagnose it, fix what I can, escalate what I cannot, and close it in writing.
- I troubleshoot the scanner, the delivery app, and building or gate access when they fail, then write up the exception so the next driver is not starting from zero.

Personal Trainer The Exercise Coach, St. Louis

2022 - 2023

- I worked one-on-one with clients every day and explained what we were doing in language they could actually use. I kept session notes and treated their information as confidential.
